1. Using pointers, write your own functions for the following:

i. String comparison
ii. String concatenate
iii. String copy
iv. String length
v. Note: Do not include in your program and implement Delete operator in your
vi. program.

2. Implement constructor and destructors through your program
3. Write a program to implement inner class in C++
4. Design a hierarchy of computer printers. Use multiple inheritance in your hierarchy. Also use friend functions and classes in your program.
5. Write Date and Time classes that allow you to add, subtract, read and print simple dates in dd/mm/yyyy and time in hh:mm:ss formats. Use function overloading in your program.
6. Implement Abstract classes in your program
7. Using virtual and pure virtual functions implement hierarchy of computer printers
8. Implement diamond problem with real life example
9. Implement exceptions and do proper management through your program
10. Implement Custom exception class
11. Implement console I/O operations through your program.
12. Assignments on files doing different operations
13. Assignments on templates
14. Assignments on STL Library
